

【What is claimed is】

1. A wireless local network financial system facility, whose financial system facility consists of following portions:

Card access portion: The portion is located at the center of the system and consists of a card data processor and a comprehensive data processor. Its function is to identify a financial card. The procedure of reading a card includes the activity of withdrawing cash.

Wireless local network card: The card is for the wireless receiving and the wireless transmission. The card is built in the interior of the card access portion.

The portion for identifying the palmprint of the right hand and the portion for identifying the palmprint of the left hand: Both portions are located at both sides of the card access portion respectively. The portions include palmprint data processor. Using the card access portion and palmprint identifying portions to identify the real identity of a cardholder, and linking the financial center database through the wireless local network card can protect the activity of consuming with a credit card and prevent stores and financial institutes from the loss of money and merchandise.

2. As the first item of "What is claimed is" says, the financial system facility can be linked with a financial center database through the wireless local network card or through the output/input T1 cable according to requests.
